

# New ADAS Testing - Application Notes

Designed for end-of-line testing, most specifically for testing AEB systems.

The benefits of the system are:

- Low cost
- Very quick and easy installation
- Immediate driver feedback on test results
- All data logged to aid record keeping
- No vehicle connections other than power
- Simple to operate with clear pass / fail indication
- Customisable display and test pass / fail parameters
- Works with either track-side reference station or 3G connection

The actual test and display options can be tailored to customer requirements, but a typical installation and test procedure is as follows:

- 1, Fit display to vehicle windscreen using suction cup.
  - 2, Pass cable for the roof mount sensor through open window.
  - 3, Fit control unit in vehicle foot well (it doesn't need to be rigidly mounted)
  - 4, Start vehicle and plug in the power connector.
  - 5, Drive vehicle around until the vehicle speed appears on the screen, and the accuracy shows as "OK", typically 1 minute.
  - 6, Drive up to the target and press "SET" to configure the target position.
  - 7, Drive vehicle towards the target, going over the set start trigger speed.
  - 8, Test will show as "in progress" during test
  - 9, At the end of the test the distance to target or speed to impact will be displayed on the screen.
- The entire procedure can be completed in around 10 minutes. The memory card can then be removed for further analysis if required.

## ADAS Testing System Components:

CATS-INS - Complete Automotive Testing System, comprising of SPEEDBOX-INS, DL2 data logger and DASH4PRO display.

GPS2 RTK - 2cm positional accuracy GNSS receiver, using either GSM or base-station for positional corrections
